

All the resource groups you require in this lab have been created for you as part of the lab setup. You can safely ignore any steps that ask you to create a resource group. Please use or select a pre-existing resource group that has a similar name to the one you are asked to create. If no similarly named resource group exists, use any existing resource group.

For access to Azure, use the following credentials:

- Azure Portal: <https://portal.azure.com/>
- Username: LabUser-58051266@cloudslice.onmicrosoft.com
- TAP: -6U22*+8

You can see your available Resource Groups by checking the Resources tab above.

[...less](#)

Azure resources such as Virtual Machine names, sizes and locations must match what is specified in these steps. Due to the nature of Cloud Slice, deployments are limited to the scope defined in the instructional steps. If the resources provisioned differ from what is outlined in the instructions, a failure notification will be received, advising this was "disallowed by policy." If you believe you have received this notification in error, please submit a support request for our team to investigate further.

If you have to copy multiple lines within a code block into an application or cloud shell prompt, consider using Notepad as an intermediate step by doing the following:

1. Open Notepad.
2. Select the symbol beside the code block to copy the code block into Notepad.
3. Select the lines of code you copied into Notepad and paste them into the application or cloud shell prompt.

Deploy a containerized app to Azure App Service

In this exercise, you create an Azure App Service web app configured to run a containerized application by specifying a container image from Microsoft Container Registry. You learn how to configure container settings, deploy the app, and verify that the containerized application is running successfully in Azure App Service.

Tasks performed in this exercise:

- Create an Azure App Service resource and deploy a containerized app
- View the results
- Clean up resources

This exercise takes approximately **15** minutes to complete.

Create a web app resource

1. In your browser navigate to the Azure portal <https://portal.azure.com>; signing in with your Azure credentials if prompted.
2. Select the **+ Create a resource** located in the **Azure Services** heading near the top of the homepage.
3. In the **Search the Marketplace** search bar, enter *web app* and press **enter** to start searching.
4. In the Web App tile, select the **Create** drop-down and then select **Web App**.

Selecting **Create** will open a template with a few tabs to fill out with information about your deployment. The following steps walk you through what changes to make in the relevant tabs.

5. Fill out the **Basics** tab with the information in the following table:

Setting	Action
Subscription	Retain the default value.
Resource group	Select rg-WebAppIod58051266 .
Name	Enter containerwebapp58051266 .

Setting	Action
Slider under Name setting	Select the slider to turn it off. This slider only appears in some Azure configurations.
Publish	Select the Container option.
Operating System	Ensure Linux is selected.
Region	Retain the default selection, or choose a region near you.
Linux Plan	Select Create new , enter ASP-rg-WebApp58051266, and then select OK.
Pricing plan	Select the drop-down and choose the Free F1 plan.

6. Select, or navigate to, the **Container** tab, and enter the information in the following table:

Setting	Action
Sidecar support	Slider should be set to the off position.
Image Source	Select Other container registries .
Access Type	Retain default Public selection.
Registry server URL	Enter mcr.microsoft.com/k8se.
Image and Tag	Enter quickstart:latest.
Startup Command	Leave blank.

7. Select the **Review + create** tab.

8. Review the selections you made, and then select the **Create** button.

It may take a few minutes for the deployment to complete. When it is finished select the **Go to resource** button.

Now that your deployment has finished it's time to view the web app. Select the link to your web app located next to the **Default domain** field in the **Essentials** section. The link will open the site in a new tab.

Note: It may take a few minutes for the deployed container app to run and display in the new tab.

Clean up resources

Now that you finished the exercise, you should delete the cloud resources you created to avoid unnecessary resource usage.

1. In your browser navigate to the Azure portal <https://portal.azure.com>; signing in with your Azure credentials if prompted.
2. Navigate to the resource group you created and view the contents of the resources used in this exercise.
3. On the toolbar, select **Delete resource group**.
4. Enter the resource group name and confirm that you want to delete it.

CAUTION: Deleting a resource group deletes all resources contained within it. If you chose an existing resource group for this exercise, any existing resources outside the scope of this exercise will also be deleted.
